*A triple Almanacke for*

**the yeere of our Lorde**

God. 1591. being the  
thirde from the  
Leape yeere.

Wherein is conteyned, not onely the  
common accompt, which in this our  
Realme is vsed, with the Romane Ka-  
lender according to the late correction  
of Gregorie: but also, the true compu-  
tation and reduction of the monethes  
to their first & ancient Feastes, Christ-  
mas day being at the Sunnes entrance  
into *Capricorn*, or shortest day: wher-  
by may easely be perceyued the  
difference, which hath happened  
want of due obseruation of the co-  
of sunne and Moone. Referred princi-  
pally to the Meridian of London, and  
for moost respectes will serue for all  
England, and many other countries  
also.

1591.

A Prognostication  
for the same yeere  
M. D. XCI.

Conteyning a short discourse of the  
Eclipse of the Moone, and of the quar-  
ters of the yeere, with other necessarie  
Rules, for the better vnderstanding of  
the Almanacke going before: wherein  
are Rules for the finding the planetarie  
hower very easely and pleasantly, as  
also the rising and setting of the Sunne  
any day throughout the yeere, referred  
with the other, to the same Meridian.

By J. D.

*Deum nescire est nihil intelligere.*

Imprinted at London by Richard  
Vatkins and James Robertes.

The Battle fought at Worston in Lancashire betwixt Duke Hambleton  
and Sir Marmaduke Langwell against Lord  
Gowdall Rumbold for y<sup>e</sup> Parliament  
upon y<sup>e</sup> 17<sup>th</sup> Day of August 1640 in y<sup>e</sup> ch  
Battle y<sup>e</sup> greatest exploiton fell upon the  
English Army began about a loon of  
the Horke and fought till 8 at night  
the Scots lost a bridge wch was y<sup>e</sup> loss of  
their Army retreated very disorderly  
the Horse never rejoined and at y<sup>e</sup> taking  
of the bridge not above 3 Regiments re-  
mained the Duke marched away wth so  
much haste was y<sup>e</sup> loss of his Army left  
upon Saturday all his Foot Regiments wch  
was taken about Nether The Scots Army  
might have fought their Army over and over  
if they had durst during y<sup>e</sup> night having

To his very friende P. L.

LL the Learned (friende P. L.) agree with one voyce, that *CHRIST* our sauiour was conceyued at the Sunnes entraunce into *Aries*, and borne vpon the shortest day, when the Sunne entred into *Capricorne*: wherefore to set Christmas vpon the shortest day, and draw the Kalender backe in proportion thereunto, me thought, was very expedient: and

the rather, because of all in generall, a reformation long tyme hath been desired, and a fruition of the Feastes, vpon their ancient times. For considering that the immouable Feastes ought to keepe the same dayes they vsed to do in euery Moneth before, it of necessitie followeth, that they must be kept at other tymes (in respect of the motions of the Sunne) then for many yeeres they haue done. As for Easter, and the moueable Feastes which folowe the course of the Moone, they were by *Constant, magnus* once corrected: but ignorance of obseruation in continuance of tyme hath bred great error sithens, in so much as many yeeres they misse their due tymes a moneth at least, and therefore of late haue had a seconde Reformation: which although it be very truely performed for Easter, and it appendances, yet the Monethes not reuocated to the true degrees of the Sunne, deserued a new animaduersion. And therefore friende P. L. I haue not attempted this, as a newe fangle, and louer of rouelities (the which I haue alwayes hated) but as a furtherer of the trueth, which I alway haue loued. *Vale, et mecum fruere. 4. Kalendus Aprilis. 1590.*

## To the Reader.

*I* was my chaunce (curteous Reader) this last Lent, to be in company of dyuers, as well Worshipfull as Learned: amongst whom, vpon occasion of talke geuen, grew sundry argumentes about the true keeping of Easter: and therevpon, as I was adiunct and thing appendant, some about the reformyng of the ~~old~~ some maynteyning the old, some the Romish Kalender, corrected by Gregorie, and some impugning them both, as not brought to their

due and ancient Perodes: Which Conference had awhyle, pro et con, and apparent manifestation of the truth shewed for a thirde correction to be required, the conclusion was an intreatie of me (who had borne a part amongst them) that at my conuenient leasure, I woulde attempt the same, agaynst the next yeere, considering that of this yeere then was welnigh a quarter spent: which motion made by suche as I could not well denie, and partly that the truth myght appeare, I willingly haue attempted. Beholde therefore a thyrde correction, both true and exacte, wherein (as in the last) none of

the immoueable Feastes are altered from their dayes of the monethes they were placed in the olde Kalender, So Easter is appoynted to the next Sunday followyng the first full Moone after the Sunnes entraunce into Aries, and the moueable Feaster in proportion to it, and euery expect satisfied: The which with all other happines, I wysht thee hartely to enjoy.

Valc. 24. Aprilis. 1590.

# Elections.

It is good to Purge, the Moone being in the wat-  
tri trigon, v<sup>z</sup>. in Cancer, Scorpio, or Pisces. *or m*

In Cancer by Electuaries, in Scorpio by Po-  
tions, in Pisces by Pills: And yf neede be,  
in Libra and Aquarius, which are indifferent  
for any Purging medicine.

The tymes of the yere fittest, are the Spring  
and Haruest: the worst, Sommer and Winter: the one for it exceeding  
colde, the other for excessive heate.

## For letting of Blood.

There are two tymes, } the one of necessitie.  
                                  } the other by election.

The first is to be vsed out of hand, or els great peryll of death may  
ensue to the partie, as in the Plurisies, and Squinancies.

The latter is to be chosen after the motion of the Moone through  
the. xii. signes, in this sort.

Let the	Phlegmatike	be let blood the Moone being in	Aries, except in the head.
	Melancholik		Sagittari, except in the thighes and hippes.
	Chollerike		Libra, in the first. 15. degrees, except in the buttockes.
			Aquarius, except in y <sup>e</sup> legges.
			Cancer, except in the breast.
			Scorpio, except in y <sup>e</sup> priuities.
			Pisces, except in the scete.

The Sanguine in any of these.

Mintion is prohibited in Leo, for that it is the house of the  
Sunne, who is alwayes repugnant to the Moone in nature. Also it  
is prohibited in Gemini, for that commonly the mintion is by some  
Veines in the armes and handes: and no man ought to touche that  
member with Iron, which the Moone then gouerneth.

Furthermore, it is good from the change to the first quarter for  
youth: from the first quarter to the full, for youth and myddle age:  
from the full to the last quarter, for myddle age and olde age: from

## Elections.

the last quarter to the change, for olde age only, according to the verse,

*Luna vetus veteres, iuuenes noualuna requirit.*

The Moone in age, the ancient sort,

Their beynes may open best:

The younger sort tyll Moone be newe,

Must let their beynes haue rest.

Last, the age of the partie to be let blood is much to be considered: for none before, tili. or after, lxx. yeeres, ought to be let blood: the first, for slendernes of the beynes: the later, for debilitie of nature, vnles the olde men be fleshy, full of blood, and strong.

## For Bathing.

Libra or Pisces, for cleynynes.

The Moone in Aries, Leo, or Sagittarius, for grosse bodyes.

Cancer, Scorpio, or Pisces, for dry bodyes.

For sweatyng, vse the same consideration which is in bathing.

Cut heere, the Moone in Libra, Sagittarius, Aquarius, or Pisces, and in the encrease.

Some Seerdes which you woulde haue to peeke fruite the same yere, the Moone being in moueable signes, as Aries, Cancer, Libra, or Capricorne: it wyll be best when she is in Virgo, Capricorne, or Cancer, if she be increasing in number. The like is to be sayd of Pisces.

But to plant Trees for continuance, let it be whylest she is in Taurus, Leo, or Aquarius.

Fell Tymber from S. Barnabies day in Iune, tyll the first Kalendes of Januarie, in the wane of the Moone.

Fell fire wood, that the stocke may soone spring, from the change to the first quarter.

To remooue Grasses, or young Trees, at the last quarter of the Moone.

Good to gelde or libbe Cattle, in Sagittarius, Capricornus, or Pisces, the Moone encreasing.

OF

1591.

## Of the Eclipse of the Moone.

The Moone this yeere shalbe Eclipsed the. xx. day of December, at. iiii. of the clocke in the morning, and almost a quarter, she being then in her proper mansion Cancer, almost corporally coniointed with the malignant planet Saturne, and within two degrees of her Dragons head in the seconde house, the house of substance and riches: which what it may presage, I leaue it to others to discusse. My meaning is not to vse long and tedious discoursing in a matter not very necessary, and familiar to euery one, considering the yeerely passions which happen to these great lychtes: and therefore with prayer to God, to auert the euill threatned thereby, I cease for this poynt.

## The beginning of the foure

### *Quarters of this yeere:*

And fyrst of the Spring.

The Spring taketh his commencement and beginning the. xi. day of March, at two of the clocke. i. minutes after noone, at such tyme as the Sunne entrech into the first scruple of Aries, making the day and nyght then equall, and the æquinoctium vernum, whereby I gather that the yeere is lyke to proue indifferent fruiteful, and temperate, neither subiect to many stormes nor helmers, neyther hindered by too exceeding drought, so that there is no want, penurie, or scarcitie, by Gods permission to be feared.

### *Of the Sommer.*

The Sommer beginneth the. xii. day of June, at. xi. of the clocke and. xxxviii. scruples in the forenoone, when the Sunne entrech into the fyft minute of Cancer, making his solstitium estiuum, longest day, and returneth againe Southward from whence he came. This season wyll proue some thing remisse in heate,

67  
A Prognostication.

Of the Eclipse of the Moone.  
Of the Autumne.

**T**he Autumne commeneeth the. xiii. day of September, at. xi. of the clocke. xiii. minutes at nyght, the Sunne entring the first scruple of Libra, the equinoctiall signe, and now hastning toward the winter tropicke, describeth an equalitie betwixt nyght and day. This quarter wyll proue something colder then the nature thereof requireth, and more moyst then vsuall.

The Winter.

**W**inter beginneth the. xii. day of December this yeere, at. iiii. of the clocke. xlv. minutes after noone, at the Sunnes first touching of the first scruple of Capricorne, his solstitium brumale, and winter Tropicke, making the shortest day and longest nyght: and endeth at the Sunnes entrance into Aries next folowynge. This quarter wyll be very colde, and kindly.

To know Sunne rising and setting.

**T**urne to the day of the moneth you desire to know, and if it be the. i. the. v. x. xv. xx. xxv. or. xxx. you may from your day looke towardes your right hand in a right line, and so vnder their titles finde them: but yf it be none of these dayes, then you must note what the difference is in minutes betwene the next day which is precisely put downe before your day, and also the next so set dooing what foloweth, and thereof take such part, or from your day abate such part as the dayes increase or decrease proportionally, wherein yf you borrow or reiect a minute or two, to make euen your accompt, it forceeth not greatly: As for example. I desire to know the Sunnes rising and setting the. iiii. of Januarie, agaynst which day I finde no numbers at all, wherfore according to my rule, I must looke for some day next vnto, nosen as here the first is, and lyke wyse for some day folowynge, as is the. v. which done. I seeke the difference, and finde it. xiii. and that I must vie proportionall subtraction, so that the number decrease: and therefore I say, yf the first day the Sunne rise at. viii.

viii. of the clocke and. iiii. minutes, that the. ii. it shal rise at. viii. and. iiii. min. and the. iiii. at. viii. and. ii. minutes, and so my demande satisfied. Here you see that euery day looſeth iust one minute, and that the difference fallcth out meete with the dayes, notwithstanding that it had beene a minute more, or lesse: as for example. iiii. or. v. you might haue accompted. iiii. or. v. iiii. at your pleasure, without any great error, and so haue made the difference match to the number of dayes.

### To finde the planetarie or artificiall houre vpon the day.

**S**ee how many howers, your houre of the clocke is from Sunrising, and multiplie these houres by. 60. and diuide them by the quantitie of your artificiall hower agreeable to the day, and the quotient sheweth how many artificiall howers and minutes of an other artificiall hower (if there be any annexed) be past: wherefore adde one to the number of howers found, & that is the hower required.  
Example.

I would know the first of Januarie what Planet reigned at. iiii. of the clocke in the after noone: I therefore abate. viii. of the clocke iiii. minutes, which is the Sunne ryse from. xv. howers. 0. min (for so is iiii. of the clocke to be reckoned, that is to say, the after noone howers are to be added to. x. i. and then Sunrising to be abated) and so there remaineth. vi. howers. lvi. which are vi. houres. lvi. minutes. Now the howers brought to minutes by multiplication of. 60. are 360. vnto which adde. 56. the minutes which are besides your howers, and so will the Sunne amount to. 416. which diuided by. 39. minutes and. 20. secondes (for so you must vnderstande the quantitie of the artificiall hower to be set dovyne in min. and secondes) yeeldeth the tenth hower: whereby you may conclude, that the tenth Planet, that is to say v. by course reckoned from the planet of the day, is the planet which then hath finished his course, and that the planet that is next in order folowynge hath begonne his course, and then reigneth for that hower and tyme. Adde therefore one vnitie to your number. 10. found, and enter the table folowynge, and so shall you finde Saturne reigning. If you finde in the quotient howers and minutes, they shewe so many

## A Prognostication.

howers past, and so many minutes more of another artificiall hower next folowynge: yea of that hower which your unitie added, and the rest altogether therewith. Note, as often as you cannot diuide your distance brought into minutes by the planetarie hower reduced to seconds, you must multiple it agayne by .60. and so bying it into seconds, as in the last example is done. Furthermore, yf your day proposed haue neyther numbers of Sunne rising, nor quantitie of planetarie hower, you must do for both, as you were taught to do for the Sunne rising, and then proceede with your rule last rehearsed.

The Table seruing to finde the planetarie hower vpon the day, where the first colume conteyning the figures 1. 2. 3. 4. and so to. 12. standeth for the number of howers, the next colume for Sunday, the thyrde for Munday. &c.

To know the planetarie hower for the nyght.

**A** Tate the quantite of your planetarie hower of that day from 120. minutes, and the remaine sheweth the quantitie of the artificiall hower for the nyght: which founde, proceede as for the day, adding your howers after midnight to, 12. and so taking your distance betweene Sunne sette and your howers, by abatynge the hower and minute of sunne sette, from your tyme proposed, counting sunne sette the beginning of the first planetarie hower for the nyght, and so successively, as this Table sheweth.

The Table for the nyght, where the lyke columes are referred to the lyke dayes of the weeke, as before.

## A Prognostication.

Phanus

To know at what hower of the clocke  
such a Planet reigneth.

**B**Et if you desire to knowe at what howe of the clocke such a Planetette beginneth his reigne, then multiply the quantitie of the planetarie howe, by one lesse then the number of the planetarie howe, whether it be. 1. 2. 3. 4. 5. 6. 7. 8. 9. 10. 11. 12. or any number vnder. 13. because there are but. 12. howers for the day, and so many for the nyght, and diuide the product by 60. if the diuident be minuts, or els by 3600. if seconds: and the quotient sheweth your desire: if any thing remaine, they are minutes, besides the howers of the clocke: which howers and minutes sounde in the quotient, adde to sunnysse, if it be for the day, or to sunset, if for the night, and so haue you your purpose. Example. For the same day aboue rehearsed, I woulde knowe when the. 4. planet, that is H. reigned? Therefore I multiplie. 39. min. 20. seconds by. 3. and diuide by. 3600. and thereof cometh. 2. howers of the clocke. 20. minutes, and. 20. seconds, which adde to. 8. howers and. 4. minutes, being sunnysse, bringeth. 10. of the clocke. 24. minutes, and 20. seconds, when the. 4. Planet began his reigne.
